MANAGEMENT PRESENTATION | ANALYTICS PORTFOLIO

Regional Sales & Marketing Performance

A source-data audited view of regional performance, product mix, customer behaviour and marketing efficiency

ANALYSIS PERIOD

January 2023 – December 2025

Prepared from the supplied transactional and campaign datasets

The commercial picture at a glance

Delivered-order scope; financial values use order subtotal unless stated otherwise.

DELIVERED ORDERS

80,679

Distinct delivered orders

DELIVERED REVENUE

₹1,984.9M

Subtotal; excludes tax and shipping

AVERAGE ORDER VALUE

₹24,602.50

Delivered subtotal ÷ delivered orders

GROSS MARGIN

7.99%

Item gross profit ÷ item revenue

WHAT THE DATA SAYS

- Revenue differences across states are overwhelmingly associated with order volume.
- High-ticket orders contribute a disproportionate share of delivered revenue.
- Marketing returns vary by channel; the ROAS revenue basis must be labelled.

WHAT NEEDS ATTENTION

- Key business metrics are calculated using defined business rules and validated against the underlying transactional data to ensure consistency and reliability.
- Campaign spend is not allocated by state, so state-level ROAS and CAC are not supportable.
- Delivered-only and all-status metrics must not be mixed.

One consistent analytical basis

The presentation uses delivered orders for sales and customer performance.

DATA INCLUDED

- Orders, order items and products
- Customers and customer reviews
- Payments, returns and shipments
- Marketing campaigns

Analysis window: 1 Jan 2023 – 31 Dec 2025

Sales geography: delivery state

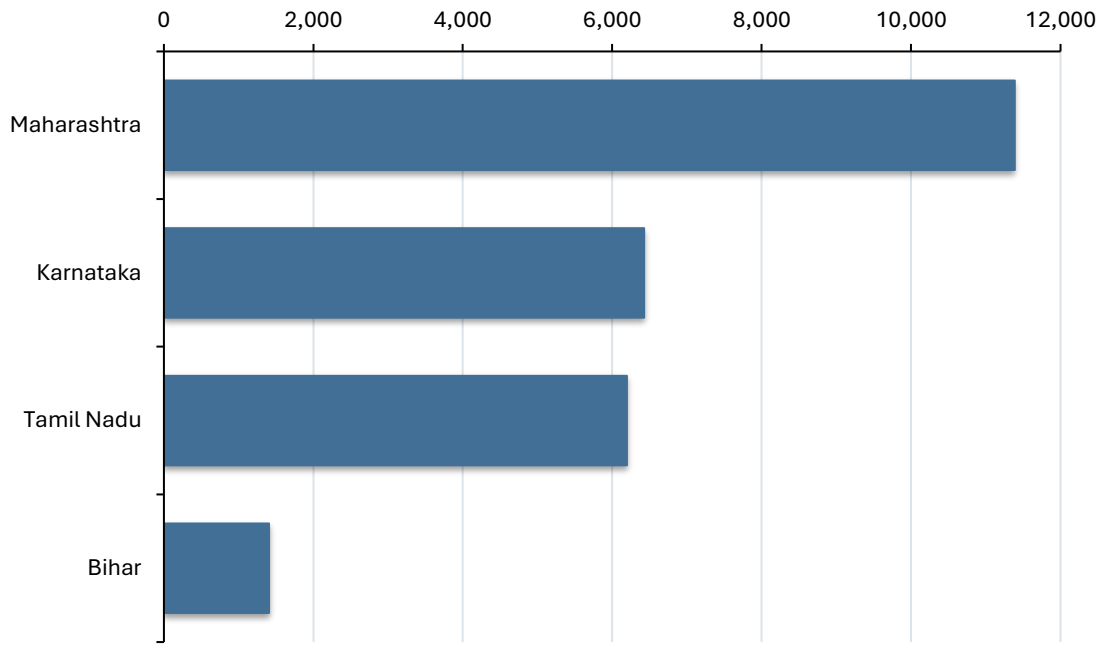

KEY DEFINITIONS

- Revenue: delivered order subtotal; excludes tax and shipping.
- AOV: delivered subtotal revenue ÷ distinct delivered orders.
- Gross profit: item revenue less item cost, before marketing, fulfilment, gateway fees and returns.
- High-ticket: delivered order subtotal at or above the delivered-order P75 threshold.

Order volume explains most of the revenue gap

State-level AOV differences are comparatively narrow and not statistically significant.

DELIVERED ORDERS | SELECTED STATES

THE VOLUME STORY

Revenue and delivered orders move together across states (correlation 0.998).

AOV IS MUCH TIGHTER

State AOV ranges from ₹23,702 (West Bengal) to ₹25,608 (Telangana).

Interpretation: prioritise diagnosing demand and order acquisition before treating small AOV gaps as strategic differences.

A relatively small group of orders drives most revenue

High-ticket is defined using the 75th percentile of delivered order subtotal.

HIGH-TICKET ORDER SHARE

25.0%

P75 threshold: ₹24,562.425

HIGH-TICKET REVENUE SHARE

76.8%

Delivered subtotal basis

TOP CATEGORY MIX

66.5%

Electronics + Appliances share of item revenue

BUSINESS IMPLICATION

Protect availability and margin in the categories that contribute most to item revenue. Test cross-sell and basket-building ideas rather than assuming high-ticket customers will respond.

IMPORTANT CAVEAT

The dashboard PDF shows High-Ticket Share of 25.80%. The source-data P75 calculation gives 25.00%; the PBIX measure and filter context need review.

Marketing efficiency depends on the revenue definition

The dashboard ROAS can be reproduced, but its numerator basis should be explicit.

CAMPAIGN SPEND

₹187.121M

Sum of campaign cost

ATTRIBUTED REVENUE

₹361.784M

Delivered campaign-linked final_amount

ROAS

1.93

final_amount basis

SAME CAMPAIGNS, DIFFERENT BASIS

Using delivered campaign-linked subtotal instead of final_amount gives ₹344.531M attributed revenue and ROAS of 1.84.

STATE-LEVEL EFFICIENCY IS NOT AVAILABLE

Campaign master data has no state allocation. Do not infer state ROAS or CAC from state revenue and national spend.

Customer metrics change with the population definition

The delivered-order cohort is used for the main report.

DELIVERED CUSTOMERS

21,849

Distinct customers with delivered orders

RETURNING CUSTOMERS

17,096

2+ delivered orders

REPEAT CUSTOMER RATE

78.25%

Delivered-cohort definition

BLENDED CAC

₹8,564.28 = ₹187.121M campaign cost ÷ 21,849 customers with delivered orders. This is a blended national indicator, not state-level CAC.

DON'T MIX COHORTS

All-status order history gives 22,820 customers and an 82.87% repeat rate. Use a consistent first-purchase definition in the PBIX.

Operational performance is mixed

The figures below use the definitions stated in the source-data audit.

ON-TIME SHIPMENTS

57.17%

Delivered shipments not flagged delayed

PAYMENT SUCCESS

94.19%

Successful ÷ successful + failed

RETURNED ORDER IDS

9,510

Distinct order IDs with a return record

DELIVERY

The exported PDF shows 57.13% on-time delivery. The source calculation is 57.17%; verify the precise shipment denominator and filter context.

RETURNS

9.51% of all orders have a return record; 11.79% of delivered orders do. The PDF's 10.43% cannot be reproduced from these denominators.

Three dashboard measures need reconciliation before release

Do not silently overwrite the PBIX values; confirm the measure logic and denominator.

Metric	Source-data result	Dashboard PDF	Action
High-ticket share	25.00%	25.80%	Check P75 and filter context
On-time delivery	57.17%	57.13%	Confirm shipment denominator
Return rate	9.51% all orders 11.79% delivered	10.43%	Define numerator and denominator

ALSO CHECK

New vs returning customer logic and delivered-only vs all-status filters.

RELEASE GATE

Align the PBIX measures with the report definitions before presenting them as one result.

Turn the analysis into controlled decisions

Recommendations are hypotheses to test, not causal claims from observational data.

01 REGIONAL GROWTH

Investigate acquisition and demand drivers in high-volume states; do not overreact to small AOV differences.

02 PRODUCT MIX

Protect availability and margin in Electronics and Appliances; test basket-building offers with a control group.

03 CAMPAIGN GOVERNANCE

Standardize attributed-revenue basis and add a governed state allocation only if the business approves one.

04 MEASUREMENT

Fix dashboard denominators, document cohort logic and track gross profit alongside revenue and ROAS.

For each experiment: define the success metric, test duration, budget guardrails and control group before launch.

Source lineage and interpretation guardrails

The analysis is grounded in the uploaded CSVs and the dataset validation report.

SOURCE TABLES

payments.csv
returns.csv
shipments.csv
customer_reviews.csv
marketing_campaigns.csv
dataset_validation_report.csv

INTERPRETATION GUARDRAILS

- Delivered-only scope for main sales/customer KPIs.
- Revenue = subtotal; excludes tax and shipping.
- Gross profit excludes marketing, fulfilment, gateway fees and returns costs.
- No state-level campaign spend allocation is available.
- Observational patterns do not establish marketing causality.

Prepared as a portfolio management presentation; unresolved metric differences are intentionally disclosed.
